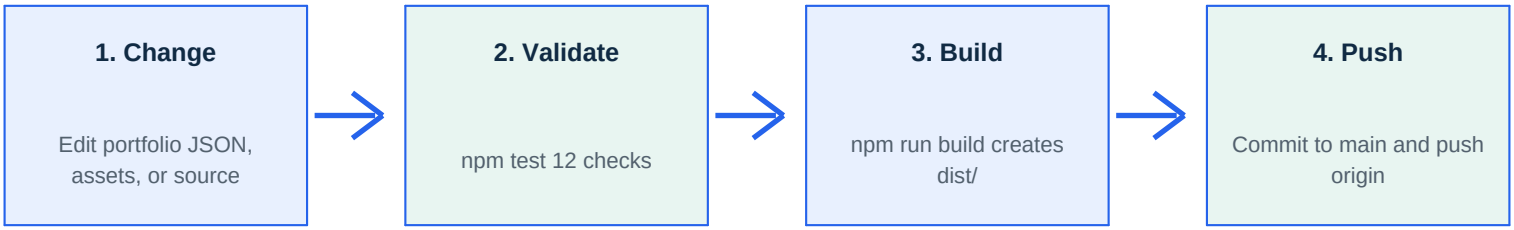
Portfolio GitHub Pages Workflow

A release path for the JSON-driven personal portfolio, from a local change to a validated public deployment.

REPOSITORY	BRANCH	HOSTING	GENERATED
websiteyalla	**main**	**GitHub Pages**	**14 October 2026**

Release flow



A push to main triggers the GitHub Actions workflow. The deployment job starts only after the build job succeeds.

Automation gates

Gate	What happens	Failure behavior
Test	Node 22 runs the portfolio test suite and validates JSON content, IDs, links, assets, visibility, and ordering.	The workflow stops; no artifact is uploaded.
Build	The validated content is copied into the deployable dist/ directory, with generated SEO metadata.	The workflow stops before Pages deployment.
Deploy	GitHub Pages receives the uploaded dist/ artifact and publishes the site URL.	The prior Pages deployment remains available while the run is investigated.

Repository commands

Local verification	GitHub Actions source

`npm test`
`npm run build`
`git add -A`
`git commit -m "Update portfolio"`
`git push origin main`
	`.github/workflows/pages.yml`
	
	`on: push to main`
	`jobs.build -> jobs.deploy`
	`artifact: dist/`

Operational notes

- The site is static and reads editable content from content/portfolio.json.
- Relative asset paths keep the site compatible with GitHub Pages project subpaths.
- If a release is faulty, use git revert and push the revert; this preserves history and triggers a fresh validated deployment.

Verification recorded: npm test: 12 passed | npm run build: succeeded | target: origin/main
